

```

PROGRAM etotr
*****
* Conversion of dielectric function to thin film transmission and      *
* reflection. The file etot.in should contain on a single line :      *
*   inputfilename (x y format)                                         *
*   teta wsamp wsub nsub                                           *
*   teta in degree, sample thickness in cm, substrate thickness in cm,  *
* real part of substrate optical constant.                           *
* the standard input file must have the format x eps1 eps2          *
* The output comes as: x t^2 r^2                                     *
